AUTHOR: Ciok, Zbigniew

TITLE: The effect of nonsimultaneous short circuits on electrical equipment

PERIODICAL: Przeglad Elektrotechniczny, no. 12, 1962, 518-521

TEXT: Statistical analysis is given of numerous tests to determine the probability of occurrence of nonsimultaneous short circuits. Tests were made with ungrounded neutral point and with the value of damping close to the one met with in practice in medium voltage networks at 10, 15 and 30 kV. Low oil-content circuit breakers were used, tests were made at 100 MVA and damping time constant = 0.1 sec. It was found that at a given angle of the instant of make it is impossible to determine the probability of occurrence of non-simultaneous short circuit because it depends on the design and condition of circuit breakers as well as circuit parameters. Maximum possible values of currents can be determined from circuit parameters and the ratio X_0/X_1 . Maximum transient peak factor is ✓

2.37 without damping. The effect of nonsimultaneous short circuits on busbar forces is considered and a maximum increase of force of 24% was found compared with simultaneous short circuit. A similar increase was found to be 40.8% in the case of current transformers. The increase of force on isolators was found to be as for busbars if the isolators are mounted in a straight line with conductors. Other forces act on contacts and are as for current transformers. Special consideration is given to circuit breakers and their classification in dealing with asymmetrical breaking. The author proposes to divide circuit breakers into two groups, one with easier and the other with more onerous switching duty depending on asymmetry and damping time constant. There are 6 figures.

Abstract	: A modified benzoate method (RZhKhim, No 16, 1956, 51122) is used for the determination of Al(3+) in binary mixtures with Fe(3+); the procedure is based on the preliminary separation of Fe(3+) by precipitation as Fe(OH) ₃ with excess NaOH (rather than reduction to Fe(2+)). The solution to be analyzed, containing Fe(3+) and Al(3+), is diluted with water to 150 ml and heated to boiling, after which an excess of 2N NaOH is added. The Fe(OH) ₃ precipitate which is formed is filtered, washed

and 45 mm in the top part serving for settling C particles carried off by the gas flow. II vapors were preliminarily heated to the reaction temperature and equally distributed in the C mass by passing through a porous glass plate, on which the layer of C was placed. The size of C grains was 75 to 100 μ . Parallel experiments were carried out with the same C in an immobile layer. The yield of I depends on the reaction temperature and reaches a maximum at 420°; at a contact duration of 3.8, 3.9 and 4 sec. and temperatures of 400, 420 and 440°, the yield of I was 67.5, 71.5 and 67% and

the conversion degree was 23.2, 34.5 and 47% correspondingly. The author arrives at the conclusion that work with a mobile C layer produces better results, as far as the yield and the purity degree of I are concerned. Besides, local overheating causing C inactivity are eliminated by the C regeneration; the temperature remains uniform in the whole mass of C during the reaction. The introduction of C circulation guarantees the process continuity, maintains the maximum yield by continuously refreshing the C with the regenerated one, utilizes the heat liberated by C regeneration.

Ciolek G., "Preservation Problems in Creating Projects for Town and Landscape Planning" (Konserwacja zespólów urbanistycznych i krajobrazowych). Architektura, No 9-10, 1949, pp. 247-256, 28 figs.

The author discusses the value of the existing old-city centres and their buildings. The importance of these historic items to the common treasure of Polish culture is enormous, and bears witness to our national share in the culture of all mankind. In order to make the best use, from the town-planning point of view, of old city features there are several methods and ways in plastic and preservation technique. It is of paramount importance that those objects, above all, which are of historic value and the condition of which call for preservation and reconstruction, should have the benefit of such methods.

of the Association of Polish Building Trade Engineers and Technicians Held in Gdańsk (1-4 December, 1949).

"Wyniki obrad VI Zjazdu Naukowego Polskiego Związku Inżynierów i Techników Budownictwa w Gdańsku (1-4 grudnia 1949 r.)". Inżynieria i Budownictwo, No. 3-4, 1950, pp. 104-109.

The workday character of the VI-th Scientific Session of the APBTET. The debates in Section I (The 6-year building plan) gave expression to the problems pertaining to the substance and features of planning. The debates in Section II (socialist attitude and work methods in the building trade) were devoted to the problems connected with work emulation, inventive trends, the rationalization movement and mass savings. The debates in Section III (the struggle for builder's materials, production and proper use) referred to economy in the management of materials and to the latest achievements in builder's materials. Section IV (struggle for design and form) dealt with the problems of town planning, architecture and co-operation between builder and architect. The article deals with the major problems raised during the Science Session which contributed largely to Polish building practice.

Constantin, Engineers (Bucharest)

TITLE: Ceramic capacitors for radio engineering

PERIODICAL: Electrotehnica, no. 9, 1960, 321 - 327

TEXT: The article presents some studies conducted by ICET on producing dielectric ceramic materials from domestic raw materials for P 100 and N 750 capacitors. The material for the P 100 capacitors was developed by ICET on the basis of steatite from the Hunedoara region. For the N 750 capacitors, the ICET developed a material consisting of titanium dioxide, zinc oxide and zirconium oxide. The main components of this material called "Ti 11", (N 750) are TiO_2 , ZnO , with additions of ZrO_2 , Al_2O_3 , and SiO_2 . The main properties vary as follows: $\text{tg}\delta$: with an increase of TiO_2 the losses drop to $\text{tg}\delta = 4 \cdot 10^{-4}$; with an increase of TiO_2 the constant increases to above 80, in case

Card 1/4

✓

Ceramic capacitors for...

R/004/60/000/009/001/001
D244/D306

of a TiO_2 content of over 80%. $TK\epsilon$: varies from +180 to -710, in a zone of 33 to 90% of TiO_2 . At temperatures above 1,100°C the crystalline phases are TiO_2 and $ZnO \cdot TiO_2$. Reducing the temperature to 800°C, the latter enters into a solid solution with TiO_2 . The titanium dioxide was of foreign origin. The determination of dielectric losses carried out with 50 capacitors in dry and humid states is given in Fig. 9. 1. number of capacitors 2. tangent of the loss angle 3. in dry state $tg\delta_{med} = 2.53 \times 10^{-4}$ 4. after moistening $tg\delta_{med} = 3.6 \times 10^{-4}$. The loss values are included in a narrow range, the "Gauss bell" having a pointed shape. After having moistened the capacitors for 24 hrs in distilled water the losses slightly increased, the shape of the curve, however, remaining the same. The loss values were maintained within the limits admitted by international standards. The distribution of the values of the dielectric losses was measured with a group of 400 capacitors, again resulting in a pointed curve. It is concluded that the manufacturing of ceramic capacitors from domestic raw materials

Card 2/4

Ceramic capacitors for...

R/004/60/000/009/001/001
D244/D306

is in accordance with the need for a rapid development of Rumanian industry. The results obtained correspond to those of foreign products, proving the possibility of manufacturing these capacitors in Rumania. There are 10 figures, 4 tables and 5 references: 4 Soviet-bloc and 1 non-Soviet-bloc. The reference to the English-language publication reads as follows: M.E. Levin: Phase diagrams for ceramics, Ohio, 1956.

Ciorănescu, Nicolae. Sur la détermination des fonctions harmoniques par leurs valeurs sur des variétés caractéristiques. *Matematica*, Timișoara 20, 137-147 (1944).

L'auteur cherche à déterminer une fonction harmonique $u(x_1, \dots, x_n)$ réelle au voisinage de l'origine en imposant que son prolongement dans le champ des x_i complexes selon le développement analytique prenne des valeurs données sur la variété $\sum x_i^2 = 0$. Dans le cas de deux variables on doit avoir $u(t, it) = f_1(t) + if_2(t)$ (réel) $u(t, -it) = f_1(t) - f_2(t)$. Les fonctions f_1, f_2 doivent être analytiques et réciproquement si on se les donne tels que quelques, on peut aus sitôt trouver u unique comme partie réelle d'une fonction holomorphe. Le cas beaucoup plus difficile de 3 variables est ensuite étudié, pour une donnée très générale, à l'aide d'une représentation intégrale des fonctions harmoniques analogue à celle de Whittaker. M. Brelot (Grenoble).

Ciorănescu, Nicula. Regular solution of a linear differential equation of the second order with variable coefficients. Acad. Repub. Pop. Române. Bul. Sti. A. 1, 725-731 (1949). (Romanian, Russian and French summaries)

Ciorănescu, Niculae. On representations by a simple series of a regular solution of Green's equation. Acad. Repub. Pop. Române. Bul. Sti. Ser. Mat. Fiz. Chim. 2, 293-297 (1950) (Romanian, Russian and French summaries)

In the first paper it is shown that a solution of the partial differential equation $u_{xx} + u_{yy} + (2\rho + 1)y^{-1}u_y = 0$, which is regular at $y=0$ and satisfies $u_y(x, 0) = 0$, is represented by

$$u(x, y) = - \int_0^1 U(x, ty)(1-t^2)^{\rho-1} dt$$

where U is a harmonic function and $U_y(x, 0) = 0$, and in the second paper this solution is expanded into a series of Bessel functions. Some related partial differential equations are also mentioned.

Vr. 13 No. 4

Clorănescu, Nicolae. On the symbolic or analytic structure
of the general integral of some partial differential equa-
tions of the second order, with constant coefficients.

Acad. Repub. Pop. Române. Bui. Sti. A., 1, 439-448
(1949). (Romanian, Russian and French summaries)

The partial differential equation $D^2u - u_{tt} = 0$, in which D is a linear differential operator in x_1, \dots, x_n with constant coefficients, has the general solution

$$u(x_1, \dots, x_n, t) = (\cos iD)f(x_1, \dots, x_n) + (\sin iD)g(x_1, \dots, x_n).$$

This symbolic solution may be interpreted analytically by means of a Taylor expansion. There is a corresponding statement for the hyperbolic equation, and a few examples.

A. Erdélyi (Pasadena, Calif.).

Tiordăcu, N. A new mean-value formula and its application to the approximate calculation of definite integrals. *Gaz. Mat. Flz. Ser. A*, 8 (1956), 19–23. (Romanian)

Continuing his work with the mean-value formula

$$\frac{M_p[fg] - M_p[f]M_p[g]}{M_p[\varphi\psi] - M_p[\varphi]M_p[\psi]} = \frac{f'(\xi)g'(\xi')}{\varphi'(\xi)\psi'(\xi')},$$

where $M_p[F] = \int_a^b p(x)F(x)dx/\int_a^b p(x)dx$, $p(x)$ is an arbitrary nonnegative weight function, and ξ and ξ' are suitable values in the open interval (a, b) [Bull. Math. Soc. Roumaine Sci. 46 (1944), 107–112; MR 7, 418], the author considers the special case $p(x) = 1$, $Q(x) = x - a$, $\varphi(x) = x - b$, which leads to the formula

$$(b-a) \int_a^b f(x)g(x)dx - \int_a^b f(x)dx \int_a^b g(x)dx = \frac{(b-a)^4}{12} f'(\xi)g'(\xi'),$$

The present paper is concerned with applications of this

Cioranescu, N.

Last formula to the approximate calculation of definite integrals. Thus it is shown that

$$\int_a^b F(x) dx = \sum_{p=0}^{n-1} (-1)^p \frac{n!(2n-p-1)!}{(2n)!(n-p-1)!(p+1)!} \\ \times (b-a)^{p+1} [F(p)(b) + (-1)^p F(p)(a)] \\ + (-1)^p \frac{n!}{12(2n)!} (b-a)^{n+2} F^{(n+3)}(\xi) X_n'(\xi),$$

where $X_n(\xi) = [(x-a)^n | x-b|^n]^{(n)} / [n!(b-a)^n]$ is the n th Legendre polynomial relative to the interval (a, b) . It is shown further that if the points $x_k = h(b-a)/n$ divide the interval (a, b) into equal parts, then

$$\int_a^b F(x) dx = \frac{b-a}{n} \left[\frac{F(a) + F(b)}{2} + \sum_{k=1}^{n-1} F(x_k) \right] \\ - \frac{(b-a)^3}{12n^3} F''(\xi).$$
